Art Unit: 2631

Information Disclosure Statement

1. The information disclosure statement filed 1/5/01 fails to comply with 37 CFR 1.98(a)(2), which requires a legible copy of each U.S. and foreign patent; each publication or that portion which caused it to be listed; and all other information or that portion which caused it to be listed. It has been placed in the application file, but the information referred to therein has not been considered.

Specification

2. The title of the invention is not descriptive. A new title is required that is clearly indicative of the invention to which the claims are directed.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 43-45 are rejected under 35 U.S.C. 102(b) as being anticipated by Bottomley (5,237,586).

Bottomley discloses a method for disspreading a received signal comprising:

storing a plurality of data samples; selectively processing the stored data

samples by combining them with chip values; and summing the result .The

processing further comprises selectively combining the stored data samples only

for the delays of interest. (See figs. 1 and 4. col.4, line 19 to col5, line 40 and

col.11 line 7 to col. 12, line 31)

Art Unit: 2631

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

5. Claims 43-45 are rejected under 35 U.S.C. 102(e) as being anticipated by Sourour et al (6,363,105)

The applied reference has a common inventor and assignee with the instant application. Based upon the earlier effective U.S. filing date of the reference, it constitutes prior art under 35 U.S.C. 102(e). This rejection under 35 U.S.C. 102(e) might be overcome either by a showing under 37 CFR 1.132 that any invention disclosed but not claimed in the reference was derived from the inventor of this application and is thus not the invention "by another," or by an appropriate showing under 37 CFR 1.131.

Sourour discloses a sliding correlator comprising: storing a plurality of data samples (2m-2M-1); selectively processing the stored data samples by combining them with chip values ($A_m = N-1$); and summing the result (813). The processing further comprises selectively combining the stored data samples only for the delays of interest. (See figs. 6, 8)

6. Claims 43-45 are rejected under 35 U.S.C. 102(e) as being anticipated by Sawahashi et al (5,768,306).

7. Sawahashi discloses a sliding correlator comprising storing a plurality of data samples (43); selectively processing the stored data samples by combining them with

chip values (45); and summing the result (46). The processing further comprises selectively combining the stored data samples only for the delays of interest. (See fig.4)

Allowable Subject Matter

8. Claims 46-49 are allowed.
9. The following is a statement of reasons for the indication of allowable subject matter: the prior art to of record fails to anticipate or render obvious the claimed sliding correlator comprising: a delay line having a plurality of delay elements; a plurality of remove chip units, each associates with an output of one of the plurality of delay elements, for removing chips from the delayed data samples; an adder for receiving output from the plurality of remove chip units and an inhibit unit for selectively enabling at least one of the plurality of remove chip units and the adder in the manner and complexity explicitly claimed in claim 46.
